OVERVIEW

To help you quickly recognize and analyze Oracle database problems, SAP provides comprehensive and fully integrated database system checking. By running regular checks and looking at the results, you can rapidly identify potential problems and take the required action before the database crashes.

The following graphic shows how the SAP system supports you in monitoring your Oracle database system:

In this paper we discuss the main functions in the figure above:

1. You schedule the database system check to run daily using the Database Planning Calendar [page 4], transactions DBCOCKPIT and DB13, in the Computing Center Management System (CCMS).
2. If required, you can configure the database system check [page 5] using transactions DBCOCKPIT and DB17.
3. When BRCONNECT has run, you can view the results [page 7] using transactions DBACOCKPIT and DB16.
4. You can also view the results of the BRCONNECT and other checks using the database alert monitor [page 9] in transaction RZ20. Transactions DBACOCKPIT and DB13 deliver the results immediately to the alert monitor.
5. BRCONNECT [page 27] is the program that performs a series of database system checks, including those for database administration, database operations, critical database messages in the Oracle alert file, and incorrectly set database parameters. It is fully integrated with the alert monitor.

Using a case study [page 23], we show you how to add a new condition to the database system check and view this in the alert monitor.

If you want to find more detailed information, look at the additional documentation [page 31] provided by SAP.

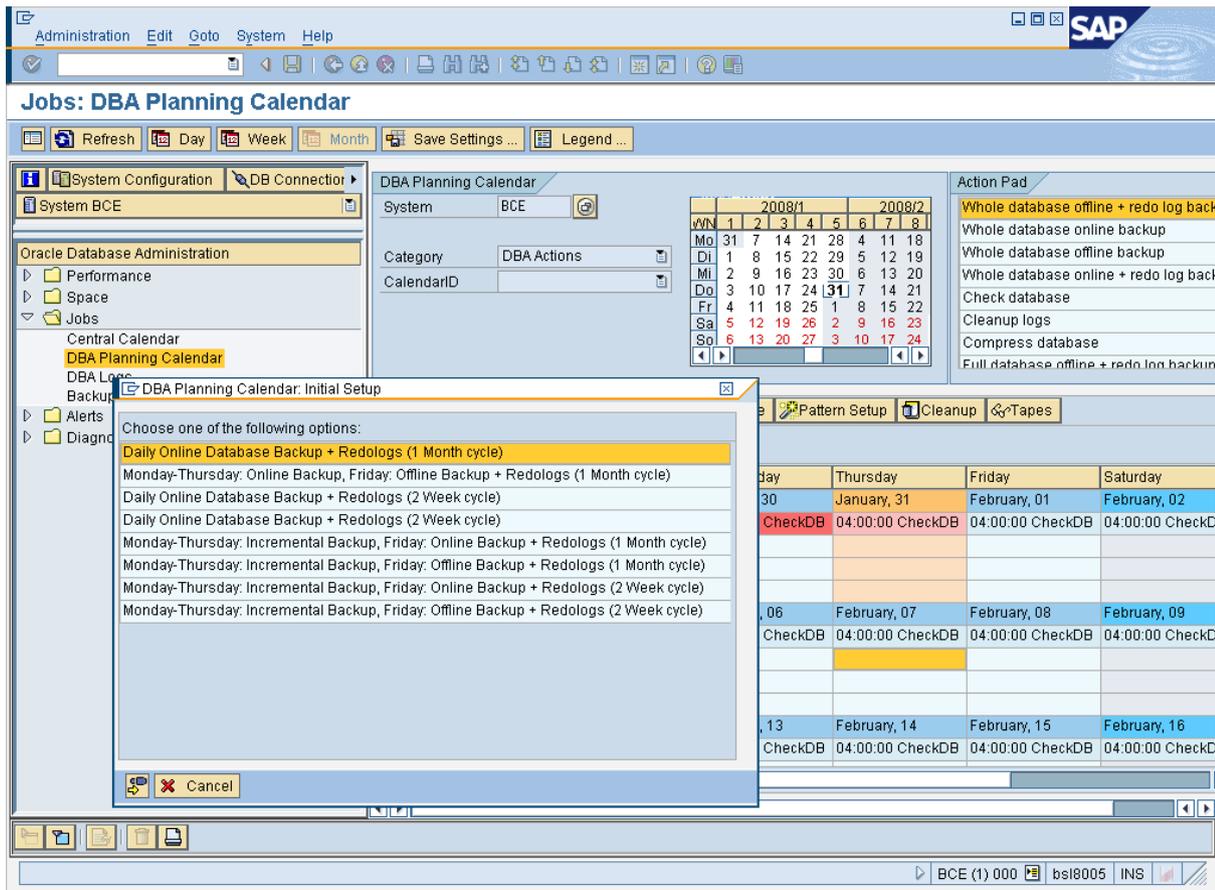

SCHEDULING THE DATABASE SYSTEM CHECK

You can schedule the Oracle database system check in the Database planning Calendar in transaction DBACOCKPIT of the Computing Center Management System (CCMS).

We strongly recommend you to schedule the check **daily**. Otherwise, you might miss important warnings and errors, possibly resulting in expensive system downtime.

The best way to do this is by selecting an action pattern, as shown in the following graphic:

Every action pattern includes a **daily** database system check. If required, you can run a database system check **immediately** using the DBA Planning Calendar.

You can also run the database system check from the command line of your operating system using `brconnect -u / -c -f check`.

For more information on scheduling the database system check, see *DBA Planning Calendar (Oracle)* in the documentation *CCMS Oracle* [page 31].

CONFIGURING THE DATABASE SYSTEM CHECK

You can configure the Oracle database system check in the Computing Center Management System (CCMS) to:

- Add new conditions of type ORA or PROF
- Exclude individual conditions from the check
- Specify threshold values for the conditions
- Create object-specific conditions to exclude them from the check
- Create object-specific conditions to set individual threshold values
- Specify corresponding corrective actions
- Maintain the condition description

For an example of how to add a new condition of type ORA, see the case study [page 23].

The configuration data is stored in the `DBCHECKORA` table. Changed or new conditions take effect the next time that `BRCONNECT` runs. You can view the results in transaction `DBACOCKPIT` or `DB16` [page 7] or the alert monitor [page 9].

To change the configuration, you use transaction `DBACOCKPIT` or `DB17`, as shown in the following graphic:

The screenshot displays the 'All Database Check Conditions for System BCE' configuration window. It includes a summary table and a detailed table of conditions.

Type	Name	Object	Object Level	Operand	Value	Unit	Period	Unit Date	User	Type	Correction Measure
DBA	ARCHIVER_STUCK		W	>	90	P				D	Save and delete archive log files
DBA	CONTROL_FILE_MIRROR		E							D	Extend CONTROL_FILES parameter
DBA	CONTROL_FILE_MISSING		E							D	Restore the file
DBA	CRITICAL_FILE		W							D	Extend the file system or change autoexte
DBA	CRITICAL_SEGMENT		W	<=	2					D	Extend the tablespace
DBA	CRITICAL_TABLESPACE		W							D	Extend the file system or change autoexte
DBA	DATA_FILE_MISMATCH		E							D	Restore the file
DBA	DATA_FILE_MISSING		E							D	Restore the file
DBA	FILE_OFFLINE		E							D	Set the database file online
DBA	FILE_SYSTEM_FULL		W	>	99	P				D	Extend the file system
DBA	HARMFUL_STATISTICS		E							D	Delete optimizer statistics
DBA	INVALID_FILE_TYPE		E							D	Check the file

For example, if you want to change the `TABLESPACE FULL` parameter above, you can do so as follows:

Change Check Condition for System BCE

Condition definition			
Condition Type	Database Administration		
Condition Name	TABLESPACE_FULL		
Check Object			
Active Flag	Yes		
Condition Level	Warning		
Check Condition	Greater than/Older	95	Percentage
Description	Tablespace full		
Corrective Measure			
Correction Type	DBA		
Corrective Action	Extend the tablespace		
Changed by			
User		Date	

In the above example, we have changed the threshold at which an alert is raised for a tablespace to 95%.

You might also decide to change the *Condition Level* from *Error* to *Warning*, deactivate the check by setting the *Active Flag* to *No*, or change the text of the *Description*.

In the following example, we have changed the threshold for a single tablespace, the SYSTEM tablespace, from 95% to 80%, by specifying SYSTEM in the Check Object field. To do this, you first need to copy the condition and then specify *Check Object* for the new condition.

Create Check Condition for Object in System BCE

Condition definition			
Condition Type	Database Administration		
Condition Name	TABLESPACE_FULL		
Check Object	SYSTEM		
Active Flag	Yes		
Condition Level	Warning		
Check Condition	Greater than/Older	80	Percentage
Description	Tablespace full		
Corrective Measure			
Correction Type	DBA		
Corrective Action	Extend the tablespace		
Changed by			
User		Date	

For more information on configuring the database system check, including changing or creating check conditions, see the following path in the documentation *CCMS: Oracle* [page 31]:

Database System Check → *Configuring Database System Check (Oracle)*

VIEWING THE DATABASE SYSTEM CHECK

To check the results of a database check you use transaction DBACOCKPIT or DB16:

Database Check: Overview of Messages for System RL3

Level	Date	Time	Days	Type	Name	Object	Num.	Description
E	20.02.2008	16:00:58	10	DBA	MISSING_INDEX		10	Table: SAPSR3.TESTDATRNRPART0 # Table has no index
E	20.02.2008	16:00:58	1	DBA	MISSING_STATISTICS		4	Table: SAPSR3.ZIAINF3 # Table or index has no optimizer s
W	20.02.2008	16:00:58	10	DBA	TABLESPACE_FULL		1	Tablespace: PSAPSSQJD, value: 95.49% (> 95%) # Tables
W	20.02.2008	16:00:58	5	DBO	STATS_TOO_OLD		1	Operation: cdxuqfp.sta, time: 2008-02-05 12.02.41 older th
E	20.02.2008	16:00:58	10	PROF	FILESYSMIO_OPTIONS		1	Value: ASYNCH (<=> SETALL) # I/O operations on file system
W	20.02.2008	16:00:58	10	PROF	LOG_BUFFER		1	Value: 14254080 (>=< 4096,512 KB) # Size of redo log buffer
W	20.02.2008	16:00:58	10	PROF	OPTIMIZER_FEATURES_ENAB		1	Value: 10.2.0.1 (set in parameter file) # Optimizer plan com
W	20.02.2008	16:00:58	10	PROF	PARALLEL_EXECUTION_MES:		1	Value: 2152 (>=< 16384,4096) # Message buffer size for par:
E	20.02.2008	16:00:58	10	PROF	QUERY_REWRITE_ENABLED		1	Value: TRUE (<=> FALSE) # Allow rewrite of queries using m
E	20.02.2008	16:00:58	10	PROF	REPLICATION_DEPENDENCY		1	Value: TRUE (<=> FALSE) # Tracking dependency for Repl
W	20.02.2008	16:00:58	10	PROF	STAR_TRANSFORMATION_EN		1	Value: FALSE (<=> TRUE) # Enable the use of star transfor
W	20.02.2008	16:00:58	10	PROF	STATISTICS_LEVEL		1	Value: TYPICAL (set in parameter file) # Statistics level

At the top of the screen, the system displays:

- **Check Results:** the number of checks that have finished with an alert. An alert is an error, a warning, or an exception (that is, a deviation from the SAP standard value).
- **Settings:** the period of results displayed, the refresh interval, and the deletion period

You can configure the display to set the:

- Number of days for which alerts are displayed
- Refresh interval after which the display is updated
- Deletion period after which old alerts are deleted

You can also drill down to look at the details of an individual check or *Message*.

For example, to look in detail at the line *TABLESPACE_FULL* above:

General Information	
Check Time	20.02.2008 16:00:59
Check Program	BRCCONNECT
Condition Type	DBA
Condition Level	W 
Condition Name	TABLESPACE_FULL
Check Object	
Check Condition	> 95 P

Detailed Information	
Description	Tablespace: PSAPSSQJD, value: 95.49% (> 95%) # Tablespace full
Correction Type	D
Corrective Action	Extend the tablespace
Check Log	/oracle/RL3/sapcheck/cdxhrenr.chk

You can choose *Check log* to view the log produced by this check. An example of the log is shown in the case study [page 23].

For more information on viewing the database system check, see the following path in the documentation *CCMS: Oracle* [page 31]:

Database System Check → *Displaying Alert Messages from Database System Check*

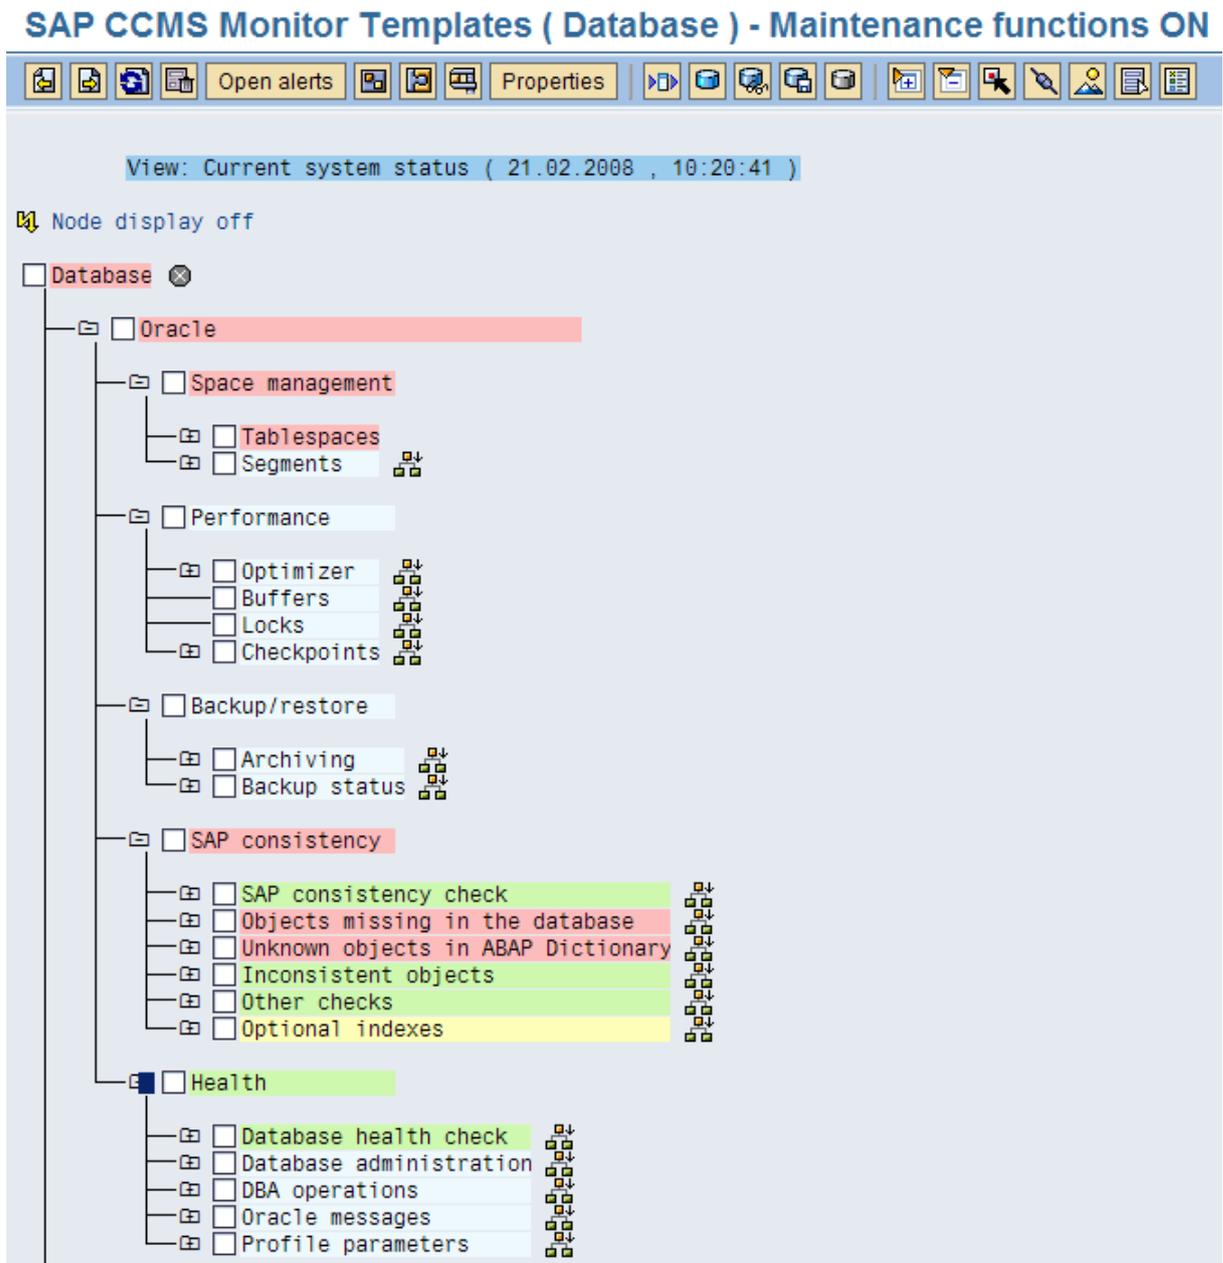

USING THE ALERT MONITOR

You use the alert monitor in the Computing Center Management System (CCMS) to check the following Oracle database functions:

- Space management – tablespaces and segments
- Performance – optimizer statistics, buffers, logs, and checkpoints
- Backup or restore – database and redo log backup
- Consistency – between database objects in the ABAP and Oracle dictionaries
- Health – database system checks from BRCONNECT

By configuring data collection tools, or methods, to run periodically, alerts are automatically updated and fed to the monitoring architecture. The main tool feeding alerts is BRCONNECT [page 27], especially for *Health* alerts. Analysis tools provide additional information about the alert conditions, and you can configure auto-react tools to automatically respond when an alert occurs.

The alerts are hierarchically arranged and grouped. This is what you see when you open the alert database monitor tree in transaction RZ20:

If you choose *Space Management* → *Tablespaces* and open some of the nodes, you see the following:

SAP CCMS Monitor Templates (Database) - Maintenance functions ON

View: Current system status (21.02.2008 , 10:20:41)

Node display off

- Oracle
 - Space management
 - Tablespaces
 - MGMT_ECM_DEPOT_TS
 - Status: offline, Yellow 21.02.2008 , 10:23:56
 - Free space: 0 MB , Red 21.02.2008 , 10:23:56
 - Used space: 0 % , Green 21.02.2008 , 10:23:56
 - MGMT_TABLESPACE
 - Status: offline, Yellow 21.02.2008 , 10:23:56
 - Free space: 0 MB , Red 21.02.2008 , 10:23:56
 - Used space: 0 % , Green 21.02.2008 , 10:23:56
 - PSAPAPPL
 - PSAPROLL
 - PSAPTEMP
 - PSAPUNDO
 - SYSAUX
 - SYSTEM

This level displays individual database checks, some derived from BRCONNECT, some not. Color-coding and the message text indicate whether there is an alert. If an alert has occurred, the message text gives more information.

You can look at the details of an alert, such as *Space management* → *Segments* → *Most allocated extents in any segment*.

Monitoring: Properties and Methods

Properties of:

MTE class:

General
PerformanceAttribute
Methods
Addnl info

Performance properties assigned from group:

Comparison Value

Last reported value

Average in the last hour

Average in the last quarter of an hour

Smoothing over last 1 min.

Smoothing over last 5 min.

Smoothing over last 15 mins

Threshold values

Change from GREEN to YELLOW	<input type="text" value="10"/>	MB
Change from YELLOW to RED	<input type="text" value="5"/>	MB
Reset from RED to YELLOW	<input type="text" value="5"/>	MB
Reset from YELLOW to GREEN	<input type="text" value="10"/>	MB

Alert is triggered if the comparative value

falls below threshold value

exceeds the threshold value

You can alter data collection methods and other attributes such as the threshold values in the monitor.

Database Alerts

This section lists the individual database alerts in the alert monitor by branch of the monitoring tree. The tables below include all possible alerts. You can tailor the tree to suit your own requirements by adding, changing, or deleting alerts.

Space Management

Type	Description
Tablespace	Freespace for each tablespace
	Used space for each tablespace
	Status (online or offline) for each tablespace
Segments	Segments with too few allocatable extents *
	Fewest allocatable extents for a segment *
	Segments approaching MAX_EXTENTS *
	Fewest extents left before MAX_EXTENTS *
	Most allocated extents in any segment *
	Segments with non-zero PCTINCREASE *
	Segments in wrong tablespace
	Rollback segment extension failed

* These alerts are only relevant for locally managed tablespaces.

Performance

Type	Description
Optimizer	Last successful update statistics
	Last brconnect -f stats run
	Harmful statistics
	Missing Statistics
Buffers	Buffer cache
	Library buffer
	Redo log buffer

Locks	Age of oldest exclusive transaction lock
	Deadlocked resource
Checkpoints	Checkpoint not complete

Backup and Restore

Type	Description
Archiving	Last successful archive log backup
	Last brarchive run
	Archiver destination full
	Archiving off
Backup Status	Last successful complete database backup
	Last brbackup run
	Tablespace in backup mode

SAP Consistency

Type	Description
SAP consistency check	Last SAP consistency check run
Objects missing in the database	Primary indexes
	Secondary indexes
	Tables
	Views
Unknown objects in ABAP Dictionary	Database tables
	Database indexes
	Database views
	Database tables without unique index
Inconsistent objects	Primary indexes
	Secondary indexes

	Tables
	Views
Other checks	Primary indexes
	Secondary indexes
	Tables
	Views
	Primary index not unique
Optional indexes	Too many indexes created
	Indexes not created

Health

Type	Description
Database health check	Last successful database check
	Last brconnect -f check run
	Last evaluation of check results
	Start of database check
Database administration	Archiver destination full
	Control file not mirrored
	Missing control file
	Critical tablespace
	Critical autoextendable file
	Critical segment
	Data file mismatch
	Missing data file
	Database file offline
	File system full
	Harmful statistics

	Invalid file type
	Segment in wrong tablespace
	Missing index
	Missing statistics
	Database in NOARCHIVELOG mode
	Segment with non-zero PCTINCREASE
	Redo log file not mirrored
	Missing redo log file
	Tablespace full
	Tablespace in backup mode
	Tablespace offline
	Segment with too many extents
DBA operations	Last successful archive log backup too old
	Last successful complete database backup too old
	Last archive log backup failed
	Last complete database backup failed
	Last operation failed
	Last update statistics failed
	Last successful operation too old
	Last successful update statistics too old

Type	Description
Oracle messages	ORA-00060 Deadlock while waiting for resource
	ORA-00255 Error archiving log file
	ORA-00257 Archiver error
	ORA-00270 Error creating archive log
	ORA-00272 Error writing archive log
	ORA-00376 File cannot be read
	ORA-00447 Fatal error in background process
	ORA-00470 LGWR process terminated with error
	ORA-00471 DBWR process terminated with error
	ORA-00472 PMON process terminated with error
	ORA-00473 ARCH process terminated with error
	ORA-00474 SMON process terminated with error
	ORA-00600 Oracle internal error
	ORA-00603 Oracle server session terminated by fatal error
	ORA-01114 I/O error writing database file
	ORA-01115 I/O error reading database file
	ORA-01122 File verification check failed
	ORA-01149 Cannot shut down – data file in backup mode
	ORA-01555 Snapshot too old
	ORA-01562 Failed to extend rollback segment
	ORA-01578 Database block corrupted
	ORA-01628 Max. extents reached for rollback segment
	ORA-01629 Max. extents reached saving undo for tablespace
	ORA-01630 Max. extents reached in temp segment in tablespace
	ORA-01631 Max. extents reached in table

	ORA-01632 Max. extents reached in index
ORA-01650	Unable to extend rollback segment in tablespace
ORA-01651	Unable to extend save undo segment for tablespace
ORA-01652	Unable to extend temp segment in tablespace
ORA-01157	Unable to extend table in tablespace
ORA-01654	Unable to extend index in tablespace
ORA-01655	Unable to extend cluster in tablespace
ORA-01656	Max. extents reached in cluster
ORA-01680	Unable to extend LOB segment in tablespace
ORA-01681	Max. extents reached in LOB segment in tablespace
ORA-01683	Unable to extend index partition
ORA-01684	Max. extents reached in table partition
ORA-01685	Max. extents reached in index partition
ORA-01688	Unable to extend table partition
ORA-01691	Unable to extend lob segment in tablespace
ORA-01692	Unable to extend lob segment partition in tablespace
ORA-01693	Max. extents reached in lob segment
ORA-01694	Max. extents reached in lob segment partition
ORA-07445	Exception encountered: core dump
ORA-16014	Destination not available for archiving log file
ORA-16038	Log file cannot be archived
ORA-19502	Write error on log file
ORA-19504	Failed to create log file
ORA-19510	Failed to set size of blocks for file
ORA-27044	Unable to write the header block of file

	ORA-27072 File I/O error
	ORA-30036 Unable to extend segment in undo tablespace
	Checkpoint not complete – Cannot switch to the next redo log file due to pending checkpoint
	Corrupt block – Database block is corrupted

CASE STUDY: ADDING A NEW CONDITION TO THE DATABASE SYSTEM CHECK

This section shows how you can add a new condition to the database system check and then display the new check. The new condition is a database message – type ORA – but the principle is the same if you want to add a new condition of type PROF.

1. You enter the new condition in transaction DBACOCKPIT or DB17:

Create Check Condition with Template for System US4

Condition definition	
Condition Type	Database Messages
Condition Name	01157
Check Object	
Function	
Active Flag	Yes
Condition Level	Warning
Check Condition	
Description	Cannot identify / lock data file

Frequency	
Periods	
Time unit	

Corrective Measure	
Correction Type	DBA
Corrective Action	Check the Oracle alert log / trace file

Changed by	
User	
Date	

The *Condition Name* is 01157, which generates an error with the *Cannot identify / lock data file*. The recommendation for this error is to *Check the Oracle alert log / trace file*.

2. Using transaction RZ20 to call up the alert monitor [page 9], you delete and then rebuild the monitoring tree on the host running the SAP central instance:
 - a) Activate maintenance functions in *View: Current system status*.
 - b) Reset all alerts in the Oracle monitoring tree.
 - c) Delete the Oracle monitoring tree.
 - d) Run ABAP program RSDBMON0 on the main application server to rebuild the monitoring tree.
3. You call up the alert monitor and see the new check condition, *ORA-01157*:

SAP CCMS Monitor Templates (Database) - Maintenance functions OFF

View: Current system status (25.02.2008 , 15:25:25)

Node display off

- Database
 - Database
 - Oracle
 - Space management
 - Performance
 - Backup/restore
 - SAP consistency
 - Health
 - Database health check
 - Database administration
 - DBA operations
 - Oracle messages
 - ORA-00060 (No value has yet been reported)
 - ORA-00255 (No value has yet been reported)
 - ORA-00257 (No value has yet been reported)
 - ORA-00270 (No value has yet been reported)
 - ORA-00272 (No value has yet been reported)
 - ORA-00376 (No value has yet been reported)
 - ORA-00447 (No value has yet been reported)
 - ORA-00470 (No value has yet been reported)
 - ORA-00471 (No value has yet been reported)
 - ORA-00472 (No value has yet been reported)
 - ORA-00473 (No value has yet been reported)
 - ORA-00474 (No value has yet been reported)
 - ORA-00600 (No value has yet been reported)
 - ORA-00603 (No value has yet been reported)
 - ORA-01113 (No value has yet been reported)
 - ORA-01114 (No value has yet been reported)
 - ORA-01115 (No value has yet been reported)
 - ORA-01122 (No value has yet been reported)
 - ORA-01135 (No value has yet been reported)
 - ORA-01149 (No value has yet been reported)
 - ORA-01157 (No value has yet been reported)

4. You run a database system check in the DBA Planning Calendar [page 4], either immediately or at the next scheduled time.

In this example, we assume that the new database check causes an alert.

5. You view the results of the database system check [page 7] using transaction DBACOCKPIT or DB16 to see the alert raised by the new condition:

Database Check: Overview of Messages for System US4

Le.	Date	Time	Days	Type	Name	Object	Num.	Description
E	25.02.2008	15:26:43	10	DBA	MISSING_INDEX		4	Table: SAPSR3.INVALID_ROWS # Table has no index
E	25.02.2008	15:26:43	10	DBA	MISSING_STATISTICS		100	Table: SAPSR3.SDB_INDUSTRY # Table or index has no optimize
W	25.02.2008	15:26:43	10	DBO	STATS_TOO_OLD		1	Operation: cdwodvj1.sta, time: 2007-11-09 11.00.33 older than 10 c
W	25.02.2008	15:26:43	0	ORA	01157		1	Time: 2008-02-25 10.50.17, line: ORA-01157: cannot identifylock
W	25.02.2008	15:26:43	10	PROF	LOG_BUFFER		1	Value: 14298112 (>< 4096,512 KB) # Size of redo log buffer in byte

E	25.02.2008	15:26:43	10	PROF	REPLICATION_DEPENDENCY		1	Value: TRUE (<=> FALSE) # Tracking dependency for Replication p
W	25.02.2008	15:26:43	10	PROF	STAR_TRANSFORMATION_EN		1	Value: FALSE (<=> TRUE) # Enable the use of star transformation
W	25.02.2008	15:26:43	10	PROF	STATISTICS_LEVEL		1	Value: TYPICAL (set in parameter file) # Statistics level

The error 01157 appears in the Name column

6. You look at the detail log.
 - a) You can see the new condition ORA-01157:

BRCONNECT Detail Log for Database US4

```

Detail log: cdxipqnz.chk

BR0964I Check conditions for database messages:

ORA-01157: cannot identify/lock data file 255 - see DBWR trace file
BR0280I BRCONNECT time stamp: 2008-02-25 15.27.40
BR0977I Checking database profile...
BR0978W Database profile alert - level: WARNING, parameter: LOG_BUFFER, value: 14298112 (>< 4096,512 KB)
BR0978W Database profile alert - level: WARNING, parameter: OPTIMIZER_FEATURES_ENABLE, value: 10.2.0.1 (set in parameter file)
BR0978W Database profile alert - level: WARNING, parameter: PARALLEL_EXECUTION_MESSAGE_SIZE, value: 2152 (>< 16384,4096)
BR0978W Database profile alert - level: ERROR, parameter: QUERY_REWRITE_ENABLED, value: TRUE (<> FALSE)
BR0978W Database profile alert - level: ERROR, parameter: REPLICATION_DEPENDENCY_TRACKING, value: TRUE (<> FALSE)
BR0978W Database profile alert - level: WARNING, parameter: STAR_TRANSFORMATION_ENABLED, value: FALSE (<> TRUE)
BR0978W Database profile alert - level: WARNING, parameter: STATISTICS_LEVEL, value: TYPICAL (set in parameter file)
BR0280I BRCONNECT time stamp: 2008-02-25 15.27.40
BR0980I Number of changed database profile parameters: 0
BR0280I BRCONNECT time stamp: 2008-02-25 15.27.42
BR0955I Number of signaled error/warning/exception alerts for database administration: 738/0/0
BR0956I Number of signaled error/warning/exception alerts for database operations: 0/1/0
BR0957I Number of signaled error/warning/exception alerts for database messages: 0/1/0
BR0958I Number of signaled error/warning/exception alerts for database profile: 2/5/0
BR0806I End of BRCONNECT processing: cdxipqnz.chk 2008-02-25 15.27.42
BR0280I BRCONNECT time stamp: 2008-02-25 15.27.42
BR0803I BRCONNECT completed successfully with warnings
    
```

7. You can also see the alert **ORA-01157** displayed in the alert monitor, transaction RZ20 [page 9]:

SAP CCMS Monitor Templates (Database) - Maintenance functions OFF

The screenshot shows the SAP CCMS Monitor Templates interface. The left pane displays a tree view of Oracle monitoring categories: Space management, Performance, Backup/restore, SAP consistency, Health, Database health check, Database administration, DBA operations, and Oracle messages. The right pane shows a list of alerts. The alert ORA-01157 is selected and highlighted, with the following details:

ORA-01157	Checked but no warning or error found
Check 25.02.2008 15:26:43 - Time: 2008-02-25 10.50.17, line: ORA-01157: cannot identify/lock data file 255	

BRCONNECT

BRCONNECT checks the following types of condition:

- Database administration – configuration, space management, database state, consistency
- Database operations – backup and archive results, failed operations
- Critical database messages in the Oracle alert file – for example, ORA-00600
- Database profile parameters in the Oracle initialization file

When it finds a critical situation, BRCONNECT writes an alert message to the detail log and to the table `DBMSGORA`. You can view the results with transaction `DBACOCKPIT` or `DB16` [page 7]. Many alerts are also passed to the alert monitor [page 9].

You can tailor the conditions to suit your own requirements [page 5]. For critical database messages or database profile parameters, you can also add new conditions.

Default Conditions for Database Administration

Condition	Severity	Description
<code>NOARCHIVELOG_MODE</code>	Error	Checks whether the database is in <code>NOARCHIVELOG</code> mode, which is not allowed for production databases.
<code>ARCHIVER_STUCK</code>	Warning	Checks the highest fill level of the archiving directory (by default, <code>oraarch</code>).
<code>FILE_SYSTEM_FULL</code>	Warning	Checks the fill level of file systems on the database host.
<code>TABLESPACE_OFFLINE</code>	Error	Checks whether there are tablespaces that are offline.
<code>TABLESPACE_IN_BACKUP</code>	Warning	Checks whether there are tablespaces that have the <code>BACKUP</code> status although <code>BRBACKUP</code> is not active
<code>TABLESPACE_FULL</code>	Warning	Checks the fill level of tablespaces in the database.
<code>DATA_FILE_MISSING</code>	Warning	Checks whether there are data files that no longer exist in the file system.
<code>REDOLOG_FILE_MISSING</code>	Error	Checks whether there are online redo log files that no longer exist in the file system.
<code>CONTROL_FILE_MISSING</code>	Error	Checks whether there are control files that no longer exist in the file system.
<code>DATA_FILE_MISMATCH</code>	Error	Checks whether there are data files that are flagged as <code>MISSING</code> in Oracle control file.
<code>INVALID_FILE_TYPE</code>	Error	Checks whether there are database files that have an illegal operating system type, for example, block raw files on Unix or compressed files on Windows.

Condition	Severity	Description
REDOLOG_FILE_MIRROR	Error	Checks whether there are online redo log files that are not mirrored on the Oracle side.
CONTROL_FILE_MIRROR	Error	Checks whether there are control files that are not mirrored on the Oracle side.
FILE_OFFLINE	Error	Checks whether there are data files or online redo log files that are OFFLINE.
CRITICAL_FILE	Warning	Examines the data files with an activated auto extend feature to see whether the file system can be brought to overflow, due to the existing parameter setting (NEXT and MAXSIZE), during the automatic file extension.
TOO_MANY_EXTENTS *	Warning	Checks whether there are tables or indices, for which the number of allocated extents exceeds the specified threshold value.
CRITICAL_SEGMENT *	Warning	Checks whether there are tables or indexes that can bring the tablespace to overflow when up to 5 next extents are allocated.
CRITICAL_TABLESPACE	Warning	Examines the data of a tablespace to see whether the file system can be brought to overflow, due to the existing parameter setting (NEXT and MAXSIZE), during the automatic file extension.
IN_WRONG_TABLESPACE	Error	Checks whether there are tables that not in a table tablespace or indices, which are not in an index tablespace.
MISSING_INDEX	Error	Checks whether there are tables that do not have any indices and are not specified in the DBDIFF table exception.
MISSING_STATISTICS	Error	Checks whether there are tables or indices that do not have any statistics, although they should have these.
HARMFUL_STATISTICS	Error	Checks whether there are tables or indices that have statistics, although they should not have these (for example, pool and cluster tables).
PCTINCREASE_NOT_ZERO *	Error	Checks whether there are tables or indexes for which the PCTINCREASE storage parameter is not equal to zero. This can lead to storage fragmentation and is not suitable for the SAP System.

* These conditions are only relevant for locally managed tablespaces.

The above check conditions are specified in the control table `DBCHECKORA`.

You cannot add new check conditions but you can change some of the above checks as follows:

- You can exclude objects – that is, individual tables and indexes or even complete tablespaces – from certain checks that run at table or index level. You do this by creating a new check condition with the relevant object in transaction `DBCOCKPIT` or `DB17` [page 5], setting its *ACTIVE FLAG* to *NO* or by specifying the object in the `check_exclude` `BRCONNECT` profile parameter.
- You can change the threshold values for individual tables and indexes

You can change the following check conditions in this way:

`TOO_MANY_EXTENTS`, `CRITICAL_SEGMENT`, `IN_WRONG_TABLESPACE`, `MISSING_INDEX`, `MISSING_STATISTICS`, `HARMFUL_STATISTICS`, `PCTINCREASE_NOT_ZERO`

Default Conditions for Database Operations

Condition	Severity	Description
<code>LAST_ARCHIVE_FAILED</code>	Warning	Checks whether the last backup of the offline redo log files with <code>BRARCHIVE</code> failed.
<code>LAST_BACKUP_FAILED</code>	Warning	Checks whether the last complete backup of the database with <code>BRBACKUP</code> failed.
<code>LAST_STATS_FAILED</code>	Warning	Checks whether the last update of the optimizer statistics with <code>BRCONNECT</code> failed.
<code>LAST_OPERATION_FAILED</code>	Warning	Checks whether the last DBA operation failed.
<code>ARCHIVE_TOO_OLD</code>	Warning	Checks whether the last successful backup of the offline redo log files with <code>BRARCHIVE</code> is too old.
<code>BACKUP_TOO_OLD</code>	Warning	Checks whether the last successful complete backup of the database with <code>BRBACKUP</code> is too old.
<code>STATS_TOO_OLD</code>	Warning	Checks whether the last successful update of the optimizer statistics with <code>BRCONNECT</code> is too old.
<code>OPERATION_TOO_OLD</code>	Warning	Checks whether the last successful DBA operation is too old.

Since the test conditions for database operations are programmed in a specific way in `BRCONNECT` (known as built-in test conditions), no new check conditions can be added to the `DBCHECKORA` table. However, this is generally not necessary because other operations can be monitored by the `LAST_OPERATION_FAILED` and `OPERATION_TOO_OLD` check conditions, or by specifying function IDs in the `PARAM` field.

Critical Database Messages in the Oracle Alert File

See “Oracle Messages” in the table “Health” [Page 16].

You can enter any Oracle error code or error text as a condition name for this condition type. BRCONNECT searches the Oracle Alert log for corresponding Oracle error messages and might then generate alert messages.

BRCONNECT Default Conditions for Database Profile Parameters

These test conditions check the values of Oracle parameters. The standard test conditions for the database profile correspond to the current SAP recommendations described in **SAP Note [830576](#)** for Oracle 10g and in **SAP Note [1431798](#)**.

You can easily adjust the test conditions for the database profile parameters, depending on the changed recommendations and for new Oracle releases.

ADDITIONAL DOCUMENTATION

SAP Library

You can find more information on Oracle database administration and the contents of this document in the SAP Library as follows:

All paths refer to SAP NetWeaver 7.3.

1. Call up the SAP Help Portal at help.sap.com/nw73 → *Application Help* → *SAP Library: English*.
2. Choose *SAP NetWeaver Library: Function-Oriented View* → *Database Administration* → *Database Administration for Oracle*.
3. Choose one of the following:
 - *SAP Database Guide: Oracle*
 - *CCMS: Oracle*

You can also find these plus selected extracts from the SAP Library at:

www.sdn.sap.com/irj/sdn/ora → *SAP on Oracle Knowledge Center* → *SAP Documentation in Help Portal*

SAP Notes

You can find more information on the contents of this document in the following SAP Notes:

- [483856](#) Description of the Alerts for Oracle Database Monitoring
- [426781](#) Corrections in the Oracle Database Monitoring
- [483659](#) BRCONNECT Support for Oracle Monitoring in RZ20
